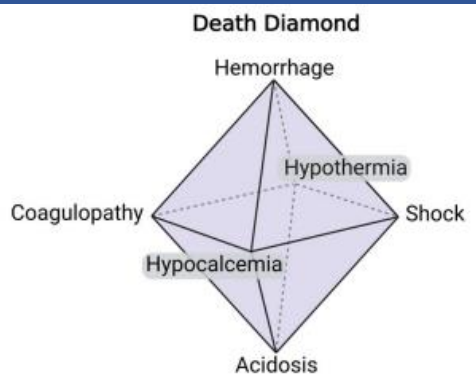
Calcium ionisé



Ionised calcium concentrations remained significantly associated with the MA on the TEG, after adjusting for platelet counts, fibrinogen concentrations, INR and aPTT

Variables	Slope of the variable (95% confidence interval)	*P*-value
Ionised calcium concentration (per 0·1 mmol L^{-1} increment)	1·1 (0·3 to 1·9)	0·011
Platelet count (per 10×10^9 L^{-1} increment)	0·2 (0·13 to 0·24)	0·001
Fibrinogen concentration (per g L^{-1} increment)	1·7 (1·2 to 2·3)	0·001
aPTT (per second increment)	−0·1 (−0·05 to −0·14)	0·001
INR (per unit increment)	0·7 (−1·3 to 2·7)	0·486

TABLE 3. Multivariable Analysis of Calcium Concentrations With ROTEM and Transfusion

ROTEM*	Coefficient	*p*	95% Confidence Interval

Conclusion

- Intérêts des test visco-élastiques :
  - Pour le pronostic : probable
  - Pour le diagnostic : probable (précocité, évaluation complète de l'hémostase)
  - Thérapeutique : probable (précocité, suivi, Tt ciblé)

- Limites :
  - Pour le diagnostic : AOD et antiplaquettaires, fibrinolyse….
  - Pour guider les traitements, impact sur la morbi-mortalité à confirmer .

Population that may benefit from VET?

Single-centre, prospective, randomized trial

algorithm based on standard laboratory assays INR, platelet count, fibrinogen, ACT	algorithm based on VET 

Patients undergoing elective cardiac surgery at high risk for perioperative bleeding.
High bleeding risk surgery included a combined CABG/valve procedure, a double or triple valve procedure or a redo surgery

interim analysis

Blood loss and transfusion requirements (RBC FFP) did not differ between groups
Bleeding was less frequent and blood loss was lower than expected:
Chest tube drainage volume <400 ml after 24 h in both group

The evidence supports the use of perioperative POC testing in patients having cardiac surgery to reduce transfusion requirements.

NICE National Institute for Health and Care Excellence

2014

Cardiac surgery

The ROTEM system and the TEG system are recommended to help detect, manage and monitor haemostasis during and after cardiac surgery.

ESAIC

2023

Cardiovascular surgery

We suggest the use of point-of-care haemostatic testing over conventional coagulation assays for the management of coagulopathy in cardiac surgery. 2C

Conclusion: role of VET in cardiac surgery

- Strong evidence: use of standardised haemostatic algorithms with pre-defined intervention triggers over clinicians' discretion for the management of coagulopathy.

- Moderate evidence: use of VET over standard laboratory assays for the management of coagulopathy

- More data needed: use of platelet function testing in combination with VET

- Population: Bleeding patients
  Patients facing high bleeding risk surgery
