Réarrangement du cytosquelette d'actine

La liaison entre la GPIIbα et le VWF est dépendante du shear

Signalisation intracellulaire varie en fonction des forces appliquées sur le récepteur

GPIIbα est liée au cytosquelette d'actine par la filamine A

Expériences d'agrégation :

Mistry. N et al., Blood, 2000

Expériences en flux :

Mistry. N et al., Blood, 2000

La dépolymérisation de l'actine potentialise l'activation par le VWF

la clusterisation**

Gitz. E et al., Haematologica, 2013

**La clusterisation se fait
dans les radeaux
lipidiques**

**Les radeaux lipidiques
sont nécessaires pour
l'adhérence sur VWF**

Shrimpton. C. N et al., J Exp Med, 2002

MICAL1 favorise la
mobilité de la GPIb dans
les radeaux lipidiques

MICAL1 permet la
clusterisation de la GPIb
dans les radeaux lipidiques
en dépolymérisant l'actine

1500 s⁻¹

La taille des tethers est augmentée sous taux de cisaillement élevés, suggérant un rôle MICAL1 dans la résistance aux contraintes de cisaillement.

L'OCS n'est pas responsable de l'allongement des tethers.

La résistance à la
